

Depressive Disorder Due to Another Medical Condition

In the Diagnostic and Statistical Manual of Mental Disorders, fifth edition, text revision (DSM-5-TR), the criteria for “depressive disorder due to another medical condition” were updated to enhance their clarity and consistency. The changes were approved by the DSM Steering Committee and APA Assembly and Board of Trustees.

Rationale for Change

Following the elimination of the DSM-IV “mood Disorders” grouping in favor of a “bipolar and related disorders” grouping and a “depressive disorders” grouping in DSM-5, a splitting of the DSM-IV categories for substance-induced mood disorders and mood disorder due to a general medical condition into their bipolar and depressive disorder components was required. This led to differences in wording of criterion A which could have resulted in the criterion mistakenly being interpreted as requiring elevated, expansive, or irritable mood or markedly diminished interest or pleasure in all, or almost all, activities, which was not the intent. Hence, the criterion was reworded in DSM-5-TR to be clearer and match that in “bipolar and related disorder due to another medical condition” and “substance/medication-induced bipolar and related disorder” to enhance the consistency in its application.

DSM is the manual used by clinicians and researchers to diagnose and classify mental disorders. The American Psychiatric Association (APA) will publish DSM-5-TR in 2022.

APA is a national medical specialty society whose more than 37,400 physician members specialize in the diagnosis, treatment, prevention, and research of mental illnesses, including substance use disorders. Visit the APA at www.psychiatry.org. For more information, please contact APA Communications at 202-459-9732 or press@psych.org.
